Rachuri Surya Lakshmi Hishitha

hishitharachuri@gmail.com|+918885035556| LinkedIn

Professional Summary

Full Stack Developer with 3 years of experience building scalable enterprise web applications using React, Node.js, and SQL. Skilled in designing component-driven UIs, developing robust RESTful APIs, managing relational databases, and deploying containerised applications with Docker. Proven track record at PwC delivering complex, cross-functional projects end-to-end.

Technical Skills

Frontend: React.js, React Context API, Component-Driven Architecture

Backend: Node.js, NestJS, Express.js, RESTful APIs

Programming Language: JavaScript (ES6+), Python

Database: PostgreSQL

Tools &Platforms: Docker, Git, GitHub, PgAdmin

Cloud: Azure, Databricks

Professional Experience

Full Stack Developer · PricewaterhouseCoopers (PwC) ***August 2023 – Present***

Airport Operations Management System | NestJS · PostgreSQL · Docker

Airport-in-a-Box platform tracking flights, airlines, gates, belts, and runways — delivering real-time operational data with role-based access for each user type.

- Architected and built 15+ RESTful APIs in NestJS for flight tracking, gate/belt assignment, and runway status monitoring using a clean, modular service pattern — cutting feature delivery time for new operational modules by 30%.
- Engineered real-time flight information services covering arrival/departure status, delay alerts, assigned belt numbers, and gate details — serving 5+ user roles and reducing operational query response time by 40%.
- Implemented Role-Based Access Control (RBAC) across user tiers — ground staff, gate agents, and administrators — reducing unauthorised access incidents by 100%.
- Designed and optimised PostgreSQL schemas across 10+ tables for schedules, assignments, and workflows; resolved query bottlenecks through strategic indexing on high-traffic tables — reducing average query execution time by 60% and improving system throughput by 35%.
- Containerised the full-stack application using Docker, enabling consistent deployments across 3 environments (dev, staging, production) and reducing environment-related deployment failures by 90%.

Workforce Architecture | Express.js · React · PostgreSQL · Docker

Enterprise platform for acquisitions and mergers — managing employee lifecycle, automating HR documents, tracking financial metrics, and enforcing role-based access.

- Developed a reusable React component library of 20+ components for HR workflows — standardised across onboarding, offboarding, and transfer modules — reducing UI development time for new features by 40%.

- Implemented global state management using React Context API for user sessions, role-based UI rendering, and real-time employee data across 500+ records — eliminating prop drilling and reducing component re-render overhead by 45%.
- Developed 12+ Express.js APIs covering the full employee lifecycle — onboarding, offboarding, transfers, and org restructuring — supporting corporate transitions for entities with 1,000+ employees.
- Built automated document generation for offer letters and resignation letters — triggered by employee status events — eliminating manual HR effort and reducing document turnaround time from 2 days to under 5 minutes.
- Designed an RBAC system with 4 granular permission tiers (employees, HR, managers, executives), ensuring data integrity and compliance across sensitive M&A workflows.
- Developed financial metrics modules tracking revenue, profit, and workforce cost data across 5+ KPIs tied to headcount changes — giving leadership real-time insight that reduced reporting lag from weekly to real-time during corporate transitions.

Data Processing Workflow | Databricks · Azure Data Lake

US workforce benchmarking pipeline — ingesting multi-client employee data, computing industry metrics, and publishing annual benchmark reports via an automated ETL workflow. Worked on a Databricks-based ETL pipeline connected to Azure Data Lake, processing employee datasets across multiple clients to generate annual US workforce benchmarks.

- Modified and maintained PySpark transformation notebooks in Databricks to clean, normalise, and compute client-specific workforce metrics — ensuring accuracy of benchmark outputs across 200+ client datasets.
- Managed multi-stage data flow across 3 pipeline phases — ingesting raw client data from Azure Data Lake, applying notebook-driven transformations, and reloading structured outputs back into Data Lake partitions.
- Monitored structured pipeline logs at each stage to identify transformation errors and load failures — enabling timely resolution of data quality issues before final benchmark output delivery.
- Produced benchmark Excel reports from transformed datasets, populated with client-specific workforce metrics, and published final outputs back to Azure Data Lake for downstream consumption.
- Supported annual release of US workforce benchmarks across multiple clients, contributing to data-driven comparisons of compensation, headcount, and productivity metrics.

Certifications &Training

- Microsoft Azure Fundamentals (AZ-900)
- Databricks Accredited Databricks Fundamentals
- Docker — Container fundamentals and deployment workflows
- Git Version Control — Branching, merging, and collaboration best practices
